Axis3D MLS Motor Laser System

Cost Saving . Flexible . Intuitive

Miners' surveying system
for cost and time optimized tunneling.

Flexible thanks to Wi-Fi

Axis3D MLS consists of a total station, a Wi-Fi connection box, and a fully ruggedized PC laptop. With the wireless connection the foreman can move around freely with the laptop within 200m (600ft) of the total station.

Axis3D Motor Laser System

New standards in resource optimization

Axis3D MLS is a surveying system designed for operation by miners. A surveyor is only needed for the initial configuration, reducing costs and time in tunneling.

Intuitive Software

The straightforward and intuitive user interface allows the foreman to work independently.

Menus adapted to proven tunneling workflows, large touchscreen buttons, and clear graphics all make work considerably easier.

Cost and Time Saving

Axis3D MLS can be set up and automatically positioned by the foreman. Even where other systems would not fit.

Predefined functions such as the positioning of the jumbo, profile checks, and the setting out for umbrella forepoling guarantee a time-optimized production process.
